

BOOTJACK

A bootjack is a device used to remove boots. Step on the faceplate with one foot, insert the other foot heel first into the yoke of the bootjack and pull your foot out of the boot.

The leather strapping is designed to protect the finest boot leather or skin from scuffing and scarring. The artist cuts and ties each strap to the yoke.

Metal bootjacks are individually sand-cast of bronze, aluminum, or cast-iron. A plastic, light-weight, collapsible model is also available.

Each bootjack has a footplate that can be personalized. Livestock brands, company logos, artwork, names and initials can be burned into the foot-plate.

The TRAVELER Series
